AMENDMENTS TO THE SPECIFICATION

Please amend the Abstract as follows:

The present invention provides an apparatus and method for performing an inverse discrete cosine transform (IDCT) in the decompression of ecompressed data-such as compressed video or audio data are decompressed using an inverse discrete cosine transform (IDCT). Performing the IDCT of the present invention includes performing a first one directional (1D) IDCT is performed resulting in a plurality of first 1D IDCT coefficients followed by a second 1D IDCT resulting in a plurality of second 1D IDCT coefficients. In performing the first 1D IDCT and the second 1D IDCT a first plurality of intermediate butterfly computations are performed which include performing a plurality of intermediate multiplications resulting in a plurality of initial products and performing a plurality of intermediate additions resulting in intermediate product which are maintained at no more than 16-bits utilizing a round near positive (RNP) rounding scheme. Following the second 1D IDCT a rounding and shifting of the plurality of second 1D IDCT coefficients is performed utilizing a round away from zero (RAZ) rounding scheme resulting in a plurality of output coefficients which comply with the IEEE 1180 standard.
